

### **New Speed ramp both calms and drains**

Rediweld's latest speed ramp, MiniSitecop, launched at this years' Traffex show, is designed to reduce vehicle speeds to only 5-10 mph but with a profile that minimises driver discomfort.

At an installation in Alton, Hampshire, MiniSitecop is used to slow vehicles as they approach some new business units. Importantly though, they are positioned below a drainage channel to act as a barrier and so prevent flash flooding, which has been a problem this summer.

MiniSitecop which is only 50mm high, joins Rediweld's existing range of speed ramps, between the original 70mm high Sitecop (0-5 mph) and the less severe SitecopPlus (10-20 mph) which is uniquely suited to HGV's. They are all made from durable recycled rubber with distinctive high visibility markings.

Rediweld also supplies Traficop speed cushions and raised tables, surface kerbing, vehicle stoppers, Takpave tactile surfaces; BusPad raised platforms and Jislon crash friendly posts.
